### EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Sadao Kinashi on June 23, 2009.

The application has been amended as follows:

Claim 7, line 10, the word "percnet" is to be replaced with "percent".

The ABSTRACT is to be amended as follows:

A method of manufacturing a copper-based catalyst having high activity and superior heat resistance and a catalyst used for steam reforming of methanol has Al alloy particles each having an oxide surface layer containing fine copper oxide particles. The Al alloy particles are produced by leaching Al alloy particles with an aqueous solution. The Al alloy particles are prepared by pulverizing a bulky Al alloy having a quasicrystalline phase, the quasicrystalline phase being represented by the formula  $\text{Al}_{100-y-z}\text{Cu}_y\text{TM}_z$  (where y is 10 to 30 atomic percent, z is 5 to 20 atomic percent, and TM indicates at least one of transition metals other than Cu). In the catalyst, the oxide surface layer containing fine copper oxide particles is formed by adjusting leaching conditions so as to form an oxide surface layer, which contains dispersed fine Cu particles and which is composed of an Al oxide and a transition metal oxide, on the

Art Unit: 1793

surface of each of the Al alloy particles. The leached Al alloy particles are heat treated in an oxidizing atmosphere, whereby some or all of the fine Cu particles contained in the oxide surface layer are converted into the fine copper oxide particles.

The following is an examiner's statement of reasons for allowance: The closest prior art is considered by examiner to be Yoshimura et al (Quasicrystal Application on Catalyst) as discussed in the prior actions, which teaches a catalyst used for steam reforming of methanol. The method is taught to comprise crushing an Al alloy having a crystalline phase (pg 451, paragraph 2) where the formula of the alloy is  $\text{Al}_{63}\text{Cu}_{25}\text{TM}_{12}$ , where TM is a transition metal (pg 452, paragraph 2, line 1). The crushed alloy particles are then leached with an aqueous alkaline solution which forms an aluminum oxide layer on the surface of the materials. The surface is considered to have Cu and CuO particles (pg 452, paragraph 3). Yoshimura does not teach a heat treatment, or substantially all of the Cu being converted to CuO on the surface.

As applicant has argued, Yoshimura teaches the samples are reduced in a hydrogen atmosphere before reaction, which is substantially different from the instant invention's performing a heat treatment in an oxidizing atmosphere and as a result, is substantially Cu rather than CuO. Further, the 20 wt% NaOH solution used is higher than the instantly claimed percentage. Moriga et al (JP 402233501) is cited in a prior action teaches a 1-40% NaOH solution, however it is taught to be used in the leaching of an Al-Cu alloy which is not pulverized.

Art Unit: 1793

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
